### CONCEPTOS BÁSICOS DE FRENOS

El sistema de frenos está compuesto de tres partes: hidráulica, fricción y mecánica.

#### Hidráulica

La parte hidráulica está basada en los principios de la Ley de Pascal la cual nos dice que **“los líquidos no se pueden comprimir y al aplicar una fuerza en un sistema hidráulico cerrado a través de un pistón transmitirá la misma fuerza a todos sus puertos de salida”**.

Bajo este principio debemos entender que el sistema de frenos funciona a base de un fluido (no comprimible) y con la ausencia total de aire en sus ductos, este elemento nos puede generar problemas si no realizamos un procedimiento adecuado al reparar un sistema de frenos.

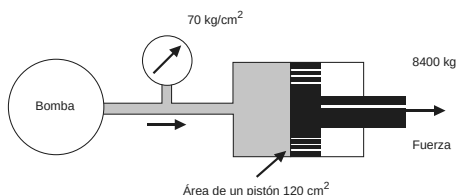

#### Fricción

Otro concepto de la física nos dice que: **“La energía no puede ser creada ni destruida sólo se puede transformar”**.

Cuando un vehículo está en movimiento tiene energía cinética y si queremos detenerlo debemos transformar ésta en otro tipo de energía que no involucre el movimiento del vehículo, como energía calorífica. Esto se logra mediante la fricción, que es la fuerza que se opone al movimiento entre dos cuerpos en contacto.

Así es que entre más peso y más energía cinética (movimiento) tenga un automóvil más difícil resulta detenerlo, esto se debe compensar con mayor presión y una mayor área de frenado para generar más fricción y disipar el calor.

Para llegar a este objetivo debemos tomar en cuenta las tres características de la fricción:

### Ley de Pascal de los líquidos a presión

#### 1. Presión

A) Dos superficies apretadas juntas se resistirán al movimiento basado en la presión aplicada.

B) La presión afecta directamente las características de la fricción.

#### 2. Área de superficie

A) Generalmente entre más extensa sea el área de superficie en la balata, más efectivo será el frenado.

B) El coeficiente de fricción puede afectar la eficiencia del frenado sobre el área de superficie.

#### 3. Coeficiente de fricción

Es el valor proporcionado a la habilidad de los materiales de desplazarse uno sobre otro.

### Coeficiente de Fricción de dos materiales diferentes: hule y madera

#### Mecánica:

La energía mecánica es transmitida por elementos sólidos (metales, pastas, líquidos y otros), la cual puede ser afectada por componentes en mal estado.

En el sistema de frenos, los componentes mecánicos como: pedal del freno, cerrajería (componentes de sujeción de las balatas), así como las mismas balatas y/o los calipers dañados afectarán la transmisión de energía mecánica.

### Componentes del sistema hidráulico

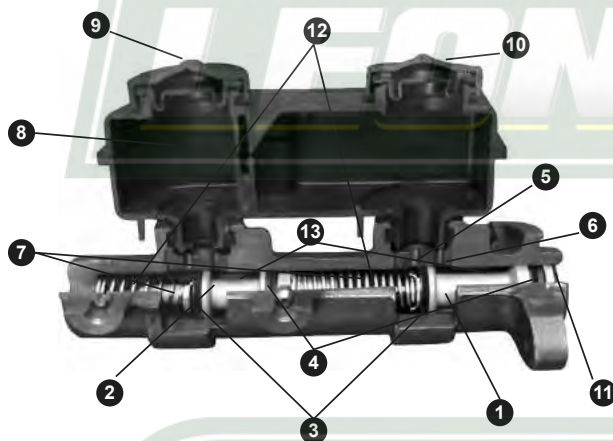

#### Cilindro maestro o bomba de frenos

Es el encargado de transformar la fuerza mecánica en presión hidráulica desde el pedal, transmitiéndose hacia los cilindros de rueda, calipers y válvulas.

## Frenos Hidráulicos

El cilindro maestro está dividido en dos cámaras (o circuitos) de acumulación de presión, las cuales están separadas para proporcionar fuerza de frenado a la mitad de los frenos en caso de fuga en uno de los dos circuitos. Los hay de 1 pistón y de 2 pistones, compuestos y de una sola pieza fabricados en aluminio y hierro nodular.

Actualmente la línea de cilindros maestros cuenta con 4 generaciones:

#### Primera Generación

Se denomina primera generación a aquellos cilindros maestros que contienen dos válvulas de presión residual en ambas salidas y que son utilizados en vehículos equipados con frenos de tambor en las cuatro ruedas.

#### Segunda Generación

Los cilindros maestros de segunda generación están equipados con 1 válvula de presión residual sólo en la salida que va a las ruedas traseras y son utilizados en vehículos equipados con frenos de disco en ruedas delanteras y de tambor en las ruedas traseras.

#### Tercera Generación

Los cilindros maestros de la tercera generación carecen de válvulas de presión residual y son utilizados en los vehículos equipados con frenos de disco en las ruedas delanteras y frenos de tambor en las ruedas traseras, asimismo en vehículos equipados con frenos de disco en las cuatro ruedas.

#### Cuarta Generación

Cilindros maestros de cuarta generación son aquellos que tienen como característica principal diferente diámetro de los pistones-primario y secundario (doble diámetro), asimismo están equipados con una válvula de accionamiento rápido. La válvula de accionamiento rápido permite el regreso de líquido para frenos al depósito cuando se generan más de 100 PSI en el sistema de frenos.

## Frenos Hidráulicos

### Válvulas de presión residual ("check")

Son las encargadas de tener presión atrapada entre el cilindro maestro y el cilindro de rueda (15 PSI) para mantener las balatas más cerca del tambor, en vehículos equipados con frenos de tambor.

### Sistemas de frenos

En el parque vehicular nacional existen, o son usados aún, tres diferentes sistemas de frenos que mencionaremos a continuación.

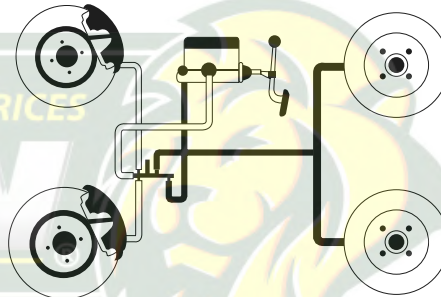

#### Sistema de frenos sencillo

Este sistema se complementa con un cilindro maestro de un solo pistón, el cual suministra de fluido a todo el sistema hidráulico al presionar el pedal; pero existe un problema con este sistema, que al presentarse una fuga de líquido para frenos en cualquier punto del sistema no habrá poder de frenado.

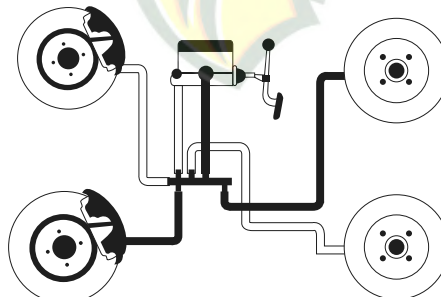

#### Sistema de frenos dividido (delantero/trasero)

Este sistema es el pionero del uso de los cilindros maestros de doble pistón, el cual nos brinda la ventaja de tener dos sistemas independientes uno adelante y otro atrás, auxiliado por una válvula de combinación o repartidora. Este sistema nos brinda un porcentaje de frenado de 60% adelante y 40% atrás.

#### Sistema doble dividido en diagonal

Utilizado en todos los vehículos de tracción delantera, como su nombre lo indica, está dividido diagonalmente (delantera izquierda, trasera derecha, delantera derecha y trasera izquierda). Al igual que el anterior, nos brinda el 50% de frenado cuando exista una pérdida de presión en uno de los dos circuitos. El porcentaje de frenado en este sistema es de 80% adelante y 20% en la parte trasera.

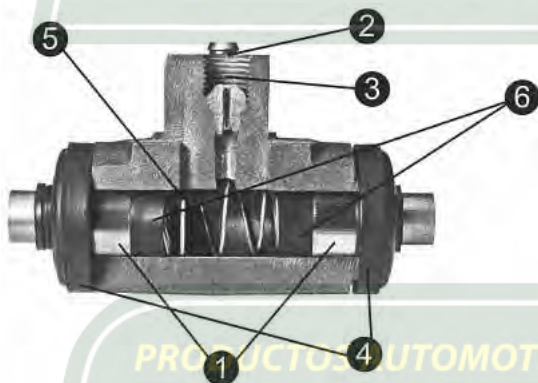

## Frenos Hidráulicos

### Cilindro de rueda

Los cilindros de rueda convierten la presión hidráulica en fuerza mecánica cuando se aplica presión desde el cilindro maestro por medio de varillas o pistones, este movimiento actúa sobre las zapatas de freno para forzarlas hacia fuera contra el tambor. En cada extremo del cuerpo del cilindro son instalados cubre polvos para mantener la suciedad fuera del cilindro.

Hay un resorte con sellos de alta presión que impide que los sellos se desplomen uno hacia el otro y mantiene la presión que se ejerce sobre los labios de los sellos asegurando un sellado correcto.

#### Partes de un cilindro de rueda

1. Pistones
2. Tornillo de purga
3. Entrada de líquido para frenos
4. Cubrepolvos
5. Resorte
6. Sellos

### Mangueras para frenos

Son usadas en las ruedas delanteras y/o traseras para dar margen al movimiento de la suspensión y dirección.

Las mangueras para frenos se pueden agrietar, ampollar o presentar fugas en las conexiones por malos manejos, por lo que es necesario que sean revisadas cada 30,000 km o cada 18 meses.

Las mangueras para frenos están fabricadas con 3 capas de hule y 2 capas de lona entramada, su diseño de fabricación hace a la manguera altamente resistente cumpliendo la especificación de la SAE, pudiendo soportar hasta 5000 PSI.

Debe ser resistente a altas temperaturas, flexible y soportar las inclemencias del tiempo.

Otros componentes por el que fluye el líquido para frenos son las tuberías, que están fabricadas con acero de doble pared para resistir la presión que se genera y recubiertas para prevenir el óxido.

2. Capa intermedia de hule
3. Capa interna de hule
4. Segunda capa de lona entramada
5. Primera capa de lona entramada.

**NOTA:** Nunca sustituya la tubería de frenos por tubería de cobre o cualquier otro material, siempre reemplace igual por igual.

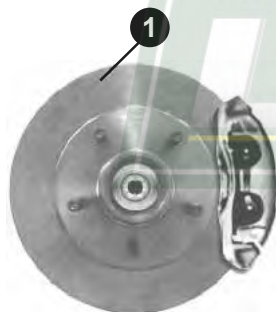

## Freno de disco

El freno de disco delantero fue introducido como innovación en 1962 en algunos vehículos Ford, con calipers de 4 pistones bastante problemáticos. Pero fue hasta 1968 cuando se introdujo el caliper del pistón, que es usado actualmente al igual que el de doble pistón (Pick Up). Algunos vehículos de modelos recientes (1994 a 2007) y de alto desempeño usan freno de disco en las cuatro ruedas, delantero y trasero.

### Las ventajas del freno de disco son las siguientes:

1. Más resistentes al desvanecimiento, por tener sus componentes expuestos a la intemperie, lo cual le ofrece mayor ventilación.
2. Frenadas más parejas o rectas, la fricción de los frenos de disco es proporcional a la presión aplicada.
3. Pueden frenar estando mojados, el agua simplemente resbala de la superficie vertical del rotor y las balatas frotan constantemente contra la superficie del rotor evitando la acumulación de agua.

### Componentes del freno de disco

2. Balatas
3. Conjunto de sello y cubrepolvo
4. Pistón
5. Pernos
6. Caliper
7. Herrajería
8. Tornillo purgador

Rotor sólido

Rotor ventilado

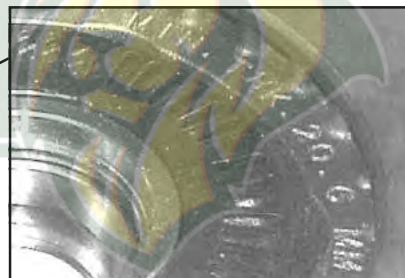

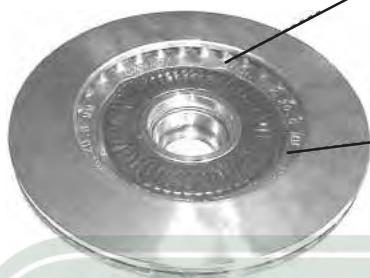

**El rotor o disco** es un componente que está expuesto a alta temperatura generada por fricción. Suele estar montado, al igual que las balatas, donde el aire puede enfriar más rápidamente las partes. Fabricados con diferentes materiales, los tipos de rotores, ya sean sólidos y/o ventilados van de acuerdo a la especificación y diseño de fabricante del vehículo.

## Frenos Hidráulicos

### Espesor del rotor

Generalmente todos los discos o rotores tienen quintado o grabado mínimo espesor que debe ser usado durante su vida útil.

Mínimo de rectificado

Es necesario realizar las mediciones y revisiones pertinentes para un mejor desempeño, ya que un disco o rotor fuera de especificaciones genera problemas en el sistema de frenos tales como: desgaste prematuro de balatas, rechinido, vibración al frenar, entre otros.

Rotor ventilado

Es necesario revisar que el rotor no tenga puntos duros, rayaduras (surcos), señal de sobrecalentamiento (disco de color azul), fracturas, así como contaminación por grasa.

## Frenos Hidráulicos

### Pistón

Fabricado de baquelita, aluminio o hierro, es el componente que, a través de la presión hidráulica, comprime las balatas contra el disco o rotor. El rotor está unido a la rueda y la detiene.

Se recomienda sustituir los pistones de baquelita (resina fenólica) por pistones de aluminio por ser más ligeros y resistentes a altas temperaturas.

### Pernos

Son los elementos que sujetan la mordaza en el porta caliper, utilizados generalmente en el caliper deslizante y protegido por bujes de hule, manteniendo una perfecta alineación del caliper con la superficie del rotor.

Pernos

### Herrajería

Se denomina herrajería de frenos ya sea de disco o tambor al conjunto de resortes, bujes, chicotes, seguros, lanas antirruido y pernos. Este grupo de componentes sirven para mantener una buena o perfecta alineación entre el material de fricción y el rotor o disco.

El buen estado de estos componentes nos ayuda a obtener una máxima duración de las balatas y evitar el desgaste prematuro de las mismas y ruidos.

En los frenos de tambor nos ayuda a mantener una perfecta separación entre las balatas y el tambor. Asimismo evita traqueteos y mal funcionamiento en los mismos.

Lainas antirruido

### Tornillo purgador

Es la válvula de escape para liberar el aire que se encuentra en el sistema de frenos asimismo, nos sirve para reemplazar el líquido para frenos cuando sea necesario.

## Frenos Hidráulicos

### Calipers

Actualmente el freno de disco en el parque vehicular nacional, utiliza tres diferentes tipos de calipers (mordaza).

#### Fijo

Contiene dos pistones, uno a cada lado del rotor. Cuando se oprime el pedal de freno, el líquido para frenos fluye del cilindro maestro hacia la parte trasera del pistón del caliper, lo que fuerza las balatas contra el rotor.

Una característica de estos calipers es el uso de pernos de retención para sujetar las balatas.

#### Deslizante

A diferencia del flotante, este caliper no utiliza tornillos como sujeción.

#### Electrohidráulico

#### Flotante

En este tipo de diseño, el caliper completo se mueve cuando el pistón es empujado fuera de éste durante la aplicación del freno. Cuando el caliper se mueve, la balata exterior es empujada contra el rotor.

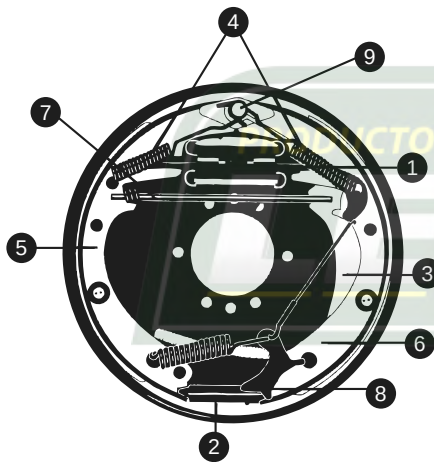

Los calipers traseros son electrohidráulicos (componentes hidráulicos y eléctricos) los cuales cuentan con actuadores que funcionan al aplicar el freno de estacionamiento presionando las balatas contra el disco en condiciones de estacionamiento, al liberar la palanca del freno los motores giran en sentido contrario a las manecillas del reloj, liberando la presión ejercida a las balatas vs. el disco provocando una separación de 0.005" lo que permite el desplazamiento del vehículo.

## Freno de tambor

El primer sistema de frenos en las ruedas (después de los frenos de mano) fue el de tambor, el cual se denomina así porque los componentes del freno se encuentran dentro de un cilindro en forma de tambor. Su diseño básico ha resultado muy efectivo en muchas circunstancias, sin embargo tiene la desventaja que cuando se somete a altos esfuerzos (frenadas en bajadas prolongadas) los frenos pierden efectividad debido a que se genera demasiado calor dentro del tambor y poca ventilación, lo que impide reducir la velocidad.

**Realice una inspección visual en el tambor antes de hacer cualquier reparación y verifique el máximo diámetro antes de enviar a rectificar, reemplazar y conformar las balatas.**

### Componentes del freno de tambor

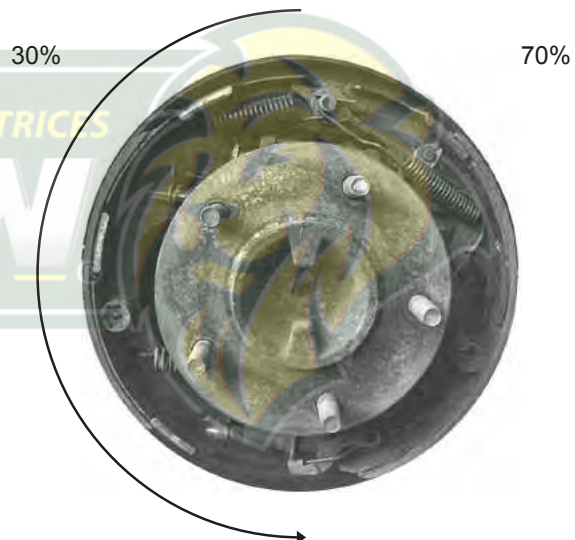

1. Cilindro de rueda
2. Tornillo ajustador
3. Palanca de freno de estacionamiento
4. Conjunto de resortes
5. Balata primaria
6. Balata secundaria
7. Separador de zapatas del freno de estacionamiento
8. Leva ajustadora
9. Punto de anclaje

Existen dos tipos de freno de tambor:

### Tipo servo

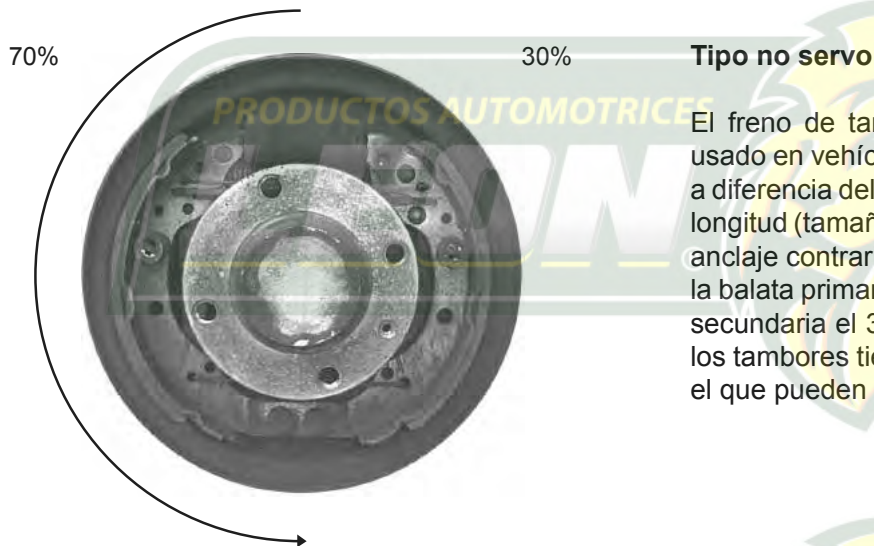

El freno de tambor de tipo servo se utiliza en vehículos de 4, 6 y 8 cilindros, funcionando en forma de cuña al ser accionado, gracias a que las balatas que son usadas en este sistema son una corta (primaria, 30% proporción de frenado) y una larga (secundaria, 70% proporción de frenado).

Una de sus características principales es el desfasamiento de las zapatas desde el punto de anclaje, la diferencia que existe entre el freno de tambor tipo servo es la ubicación del tornillo ajustador en la parte opuesta al cilindro de rueda, y el tipo no servo el tornillo de ajuste se encuentra junto al cilindro de rueda.

## Frenos Hidráulicos

### Tipo no servo

El freno de tambor tipo no servo generalmente es usado en vehículos compactos de tracción delantera; a diferencia del tipo servo, las balatas tienen la misma longitud (tamaño) y se encuentran fijas en su punto de anclaje contrario al cilindro de rueda; además de que la balata primaria ejerce el 70% de frenado y la balata secundaria el 30%. Al igual que los rotores o discos, los tambores tienen grabado el máximo diámetro con el que pueden ser utilizados.

### Freno de estacionamiento

El freno de estacionamiento tiene sus orígenes antes de 1967, cuando casi todos los vehículos utilizaban cilindros maestros de un solo pistón que accionaba los frenos de las cuatro ruedas; si el líquido se fugaba en una rueda se perdía el funcionamiento del sistema de frenos, por lo que requería de un método independiente para detener el vehículo en caso de emergencia.

Después de 1967 se reglamentó el uso de cilindros maestros dobles, donde la mitad del sistema de frenado era independiente. En caso de alguna falla, una lámpara de advertencia en el tablero se encendería indicando que ha ocurrido un desperfecto.

El término "Freno de estacionamiento" ha reemplazado al término "Freno de emergencia" desde el uso de los cilindros maestros dobles.

Siempre que se emplea el freno de estacionamiento se enciende la luz roja del BRAKE en el tablero de instrumentos, en casi todos los vehículos esta misma lámpara se enciende cuando existe un problema hidráulico o de nivel de líquido para frenos.

Esta lámpara de advertencia indica al conductor cuando el freno de estacionamiento está parcialmente o totalmente aplicado, para evitar daños o sobrecalentamiento a las balatas.

En vehículos de General Motors la luz roja de advertencia también indica códigos de falla del ABS según la brillantez.

Los frenos de estacionamiento se pueden aplicar por medio de una palanca manual o un pedal que se acciona con el pie, se utilizan cables de acero protegidos por un recubrimiento de plástico denominado "funda".

**Baleros**

Uno de los baleros más utilizados en la industria automotriz es el de rodillos cónicos, el cual está diseñado para aceptar el empuje axial y radial, y debe recibir mantenimiento con regularidad.

Una instalación inadecuada puede disminuir la duración de los baleros, dañar la maza del vehículo y afectar la estabilidad del frenado.

**Retén de grasa**

Una de las partes más importantes y a la vez más ignoradas al dar servicio completo al sistema de frenos es el retén de grasa del balero.

Su trabajo es retener la grasa o aceite para evitar contaminación en las balatas. Asimismo sirve para evitar la entrada de suciedad, polvo o agua al interior del balero o al lubricante.

**Booster**

Es el elemento que nos ayuda a multiplicar la fuerza (1 x 6 veces) que aplicamos al pisar el pedal de freno para incrementar la presión hidráulica que va hacia los frenos.

Casi todos los reforzadores de frenos de potencia trabajan con vacío, que se obtiene del múltiple de admisión del motor. Un vacío es una presión inferior a la atmosférica y se mide en milímetros de mercurio o pulgadas de mercurio. Contiene 1 o 2 diafragmas de hule conectados al pedal de freno en un extremo y por el otro extremo al cilindro maestro, siendo éste un equipo de norma para todos los vehículos equipados con o sin frenos ABS.

**Existen tres tipos de booster:****Tipo suspendido en vacío**

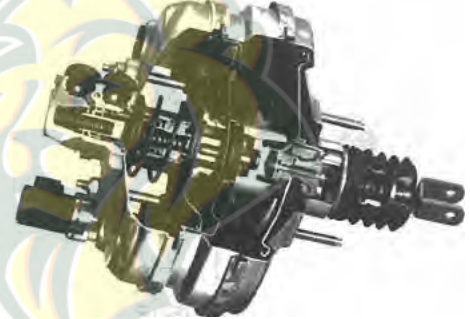

El cual es alimentado por vacío del motor (15 a 20 pulgadas de vacío). Contiene un diafragma de hule conectado al pedal del freno en un extremo y por el otro extremo al cilindro maestro.

## Frenos Hidráulicos

### Tipo doble diafragma

El método usual para aumentar el área del diafragma de vacío era incrementar el diámetro del reforzador de vacío. Sin embargo ocupaba demasiado espacio bajo el cofre, así que en su lugar, los fabricantes usaron dos diafragmas de diámetro más pequeños y colocaron uno delante del otro, este diseño aumentó el área total sin incrementar el diámetro físico del reforzador.

### Hidrobooster

Es una unidad de asistencia por potencia accionada hidráulicamente. Utiliza el fluido hidráulico con sobrepresión de la bomba de dirección hidráulica del vehículo como fuente de energía, en vez de vacío como se usa en reforzadores de vacío.

### Válvulas hidráulicas

Existen tres tipos de válvulas hidráulicas usadas en los sistemas de frenos: válvula repartidora, válvula de proporción y válvula sensora de carga (de altura).

#### Válvula repartidora (combinación o triple)

La encontramos como equipo de norma en vehículos de tracción trasera, el objetivo de esta válvula es modular igual presión tanto al circuito trasero como al circuito delantero, cuando se aplica ligeramente el pedal del freno.

Formada por tres válvulas:

##### 1. Válvula de proporción (válvula de control de presión)

Permite que se envíe presión del cilindro maestro de máximo 300 PSI, ya que arriba de esta presión se reduce el volumen de las ruedas traseras evitando el bloqueo de las mismas al limitar la cantidad de presión que se envía.

Los vehículos equipados con división diagonal emplean una válvula para cada freno trasero. Entiéndase que son dos unidades por separado.

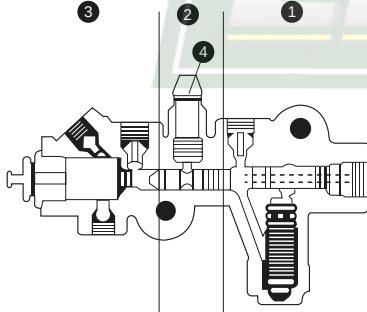

Nota: No retire las válvulas de proporción, cuando estén dañadas reemplácelas si es necesario.

##### 2. Válvula de presión diferencial

La función de esta válvula es la de monitorear la pérdida de presión en cualquiera de los circuitos hidráulicos del sistema de frenos. Una caída de presión ocasiona que se prenda la luz roja de advertencia.

### 3. Válvula métrica

Se usa en casi todos los vehículos de tracción trasera y es la encargada de retener por fracción de segundos la presión hidráulica hacia las ruedas delanteras cuando es generada una frenada de emergencia, permitiendo se activen primero los frenos traseros. Esto permite la aplicación simultánea de los frenos traseros y delanteros para lograr un frenado parejo.

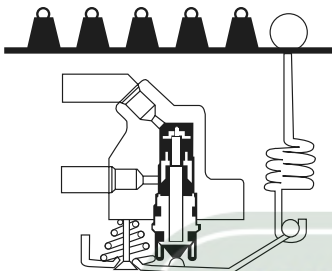

#### Componentes de la válvula triple

1. Válvula proporcionadora
2. Válvula de presión diferencial
3. Válvula métrica
4. Interruptor de presión diferencial

### Válvula sensora de carga (de altura)

Instalada en la parte trasera del chasis del vehículo y conectada por medio de una leva al eje trasero, muchos vehículos usan una válvula de proporcionamiento que modifica la presión hacia los frenos traseros de acuerdo con la altura de la suspensión. Si el vehículo tiene carga ligera, la suspensión estará alta especialmente durante el frenado, en este caso se reduce la cantidad de presión a los frenos traseros evitando que se bloqueen, por lo contrario cuando se carga un vehículo, la suspensión trasera se fuerza hacia abajo, obligando a la leva de la válvula a moverse hacia arriba para permitir una mayor presión de líquido hacia los frenos traseros, generando un mayor poder de frenado.

### Líquido para frenos

Es el transmisor de fuerza desde el cilindro maestro hasta los calipers y cilindros de rueda por medio de mangueras y tuberías, para producir movimiento en los componentes mecánicos y de fricción.

Existen líquidos para frenos en tres clasificaciones:

Líquido para frenos, factores y su punto de ebullición:  
 DOT 3 - Base en glycol 206°C, 95% de los vehículos.

DOT 4 - Base en glycol 236°C, 3% de vehículos como Honda y Mitsubishi.

DOT 5 - Base en silicón 350°C, 2% de vehículos como BMW, Mercedes Benz, maquinaria para la construcción de carreteras.

El líquido para frenos puede tener una versión para trabajo pesado con un punto de ebullición más alto.

## Frenos Hidráulicos

Los recipientes del líquido para frenos deberán permanecer cerrados ya que es higroscópico, lo cual quiere decir que absorbe la humedad y ocasiona oxidación, corrosión y sedimentos, provocando restricción en los canales del ABS.

Se recomienda revisar el líquido para frenos cada dos años en vehículos de frenos convencionales y cada año en vehículos equipados con ABS.

Asimismo obtener una muestra del líquido del vehículo en el cual estamos trabajando para ser analizado, con la intención de determinar si es necesario reemplazarse.

## Purgado del sistema de frenos

Purgar los frenos es eliminar del sistema hidráulico todo el aire atrapado. Se puede introducir aire en el sistema hidráulico siempre que se abre una conexión de la tubería o la unidad de frenos hidráulicos (cilindro maestro y/o el modulador hidráulico del ABS).

Existen varias formas de purgar un sistema de frenos pero no todas son efectivas ni recomendables.

### Purga manual

La purga manual es el proceso de aplicar presión (con la ayuda de otro mecánico) al pedal del freno, mientras se abre ligeramente la válvula de purga (purgador), de esta forma se aplica presión sobre el líquido que es forzado a salir junto con el aire a través del tornillo purgador.

### Purga con presión

Es un método en el que se aplica presión al sistema hidráulico por el cilindro maestro, utilizando un tanque de presión formado por dos cámaras, una para líquido y una para aire, que se encuentran separadas por un diafragma de hule. Éste último es cargado con aire comprimido para que el líquido fluya al abrir la válvula de alimentación, una vez instalado el adaptador necesario. Este tipo de purga es sumamente efectiva y sólo requiere de una persona para poder realizarse.

*Al presionar el pedal se abre el tornillo purgador*

### Purga con vacío

Otro purgado muy popular entre los técnicos es con una bomba de vacío (manual o eléctrica) para aspirar el líquido a través del purgador e introducirlo en un recipiente. Este tipo de purgado se puede realizar sin la necesidad de otro técnico.

### Purga por gravedad

Se realiza abriendo el purgador dejando que el líquido fluya por sí sólo, este método de purga no es recomendable ya que puede generar grandes problemas en el sistema de frenos.

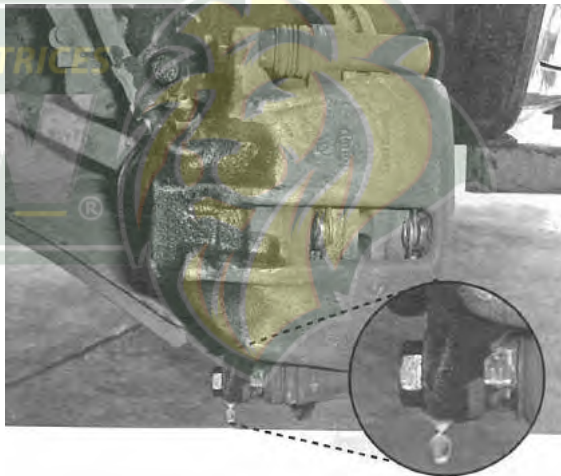

### Purga de flujo continuo

Este método se lleva a cabo con dos personas, una de ellas presionará el pedal del freno para generar presión en el sistema hidráulico y forzar a que el líquido y el aire salgan por el orificio donde se instala el purgador. Se realiza de la siguiente manera:

1. Se pisa el pedal del freno hasta el fondo, y sin soltarlo se retira el tornillo purgador.
2. Una vez retirado se coloca el dedo pulgar (funciona como válvula de alivio ya que permite la salida del fluido y el aire, pero no permitirá que se introduzca aire al sistema de frenos).
3. Se procede a bombear el pedal del freno durante quince veces haciendo una pausa de cinco segundos con el pedal arriba entre cada pisada.
4. Una vez concluidos los quince bombazos se presiona el pedal a fondo y sin soltarlo retiramos nuestro dedo y se coloca el tornillo purgador. Esta operación se realizará en las tres ruedas restantes. Es necesario que revisemos constantemente el nivel del líquido para frenos cuidando que no llegue a estar vacío.

### Purgado de cilindro de rueda VW Sedán

Como todos sabemos al modelo Volkswagen Sedán de los años 92, 93 y 94 con frenos de tambor en las 4 ruedas, por diseño del fabricante, se le colocó un cilindro maestro de doble pistón. El siguiente tip es para la purga de frenos del Volkswagen Sedán.

En las ruedas delanteras sabemos que los cilindros de rueda están colocados verticalmente, para lograr una purga rápida y adecuada, se recomienda el siguiente procedimiento:

1. Retire el cubrepolvo, el pistón y la goma superior de los cilindros de rueda, el líquido empezará a salir por el orificio de la tubería hasta el ras del cilindro.

2. Sumerjamos la goma en el cilindro en forma vertical, ya cubierta la goma con líquido para frenos le vamos a ayudar empujándola con el dedo para que se acomode en su posición correcta.

3. Coloquemos el pistón y el cubrepolvo. La rueda delantera estará purgada correctamente.

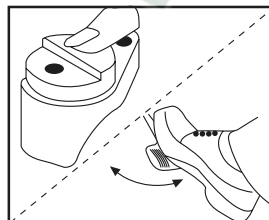

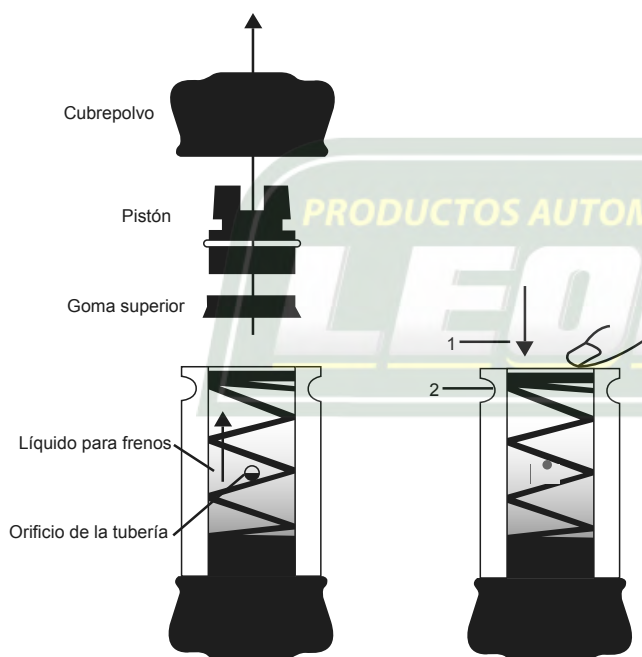

4. El siguiente paso es colocar las balatas, resortes y tambor de la rueda ya que el cilindro está purgado al 100%. Repitamos la misma operación en la otra rueda delantera.

5. Para las ruedas traseras, con el pedal pisado a fondo quitamos el tornillo purgador y en el orificio donde va éste, colocamos nuestro dedo, el cual deberá mantener presionando durante todo el proceso.

Posteriormente, la persona que está al volante presionando el pedal del freno bombeará 15 veces este dejando espacios de 5 segundos entre cada pisada; es decir, pisar y soltar el pedal del freno y esperar 5 segundos para repetir la operación.

Esto nos ayudará a limpiar las tuberías de frenos. Una vez concluidas las 15 repeticiones, sin soltar el pedal del freno, retire el dedo y coloque el tornillo purgador.

*Recordemos que el líquido para frenos lo tenemos que cambiar mínimo cada año.*

## Frenos Hidráulicos

### Purgado de los cilindros de embrague hidráulicos

Las recomendaciones para un mejor purgado son las siguientes:

#### 1. Llenado del cilindro de clutch

Se recomienda previamente llenar el cilindro al ras con líquido para frenos por medio de una jeringa, ya que la mayoría de éstos no cuentan con tornillo de purga. Este llenado debe ser con el cilindro de clutch inferior en posición vertical.

Llenado del cilindro de clutch en posición vertical

#### 2. Procedimiento de purga

Para purgar se requiere de 2 personas. Se llena el depósito con líquido para frenos, una persona taponea la manguera en la parte inferior (sin despegar el dedo de la manguera durante el proceso de purgado para que éste funcione como válvula check), la otra persona pisa el pedal del clutch y lo acciona por 15 veces, dejando un descanso de 5 segundos entre cada bombeo.

Transcurridos los 15 bombeos el pedal del clutch debe quedar oprimido.

#### 3. Conectar la manguera en el cilindro inferior de clutch previamente purgado

Una vez conectada la manguera podrá soltar el pedal de clutch. Al efectuar estos sencillos pasos su purga estará bien realizada sin problemas de aire, además de que se aprovecha el cambio de líquido sucio por nuevo.

## Frenos ABS

### Frenos ABS

El sistema de frenos antibloqueo (ABS) ha estado presente por décadas, pero de diferente forma a como lo encontramos en los vehículos actuales. La aplicación de los frenos ABS era exclusiva de los vehículos deportivos y/o tuning.

En la actualidad, el ABS es opcional en algunos vehículos de acuerdo al equipo de seguridad. Es un sistema muy confiable, completamente automático y nos ayuda en situaciones de conducción peligrosa.

Usted como técnico en frenos encontrará diferentes sistemas de frenos antibloqueo como: Bendix, Kelsey-Hayes, Teves, Delco, Delphi y Bosch.

El objetivo de todo sistema de frenos es detener cualquier vehículo en movimiento completamente cuando el conductor lo requiera. Esta acción se lleva a cabo cuando el líquido presurizado llega a un conjunto de freno de rueda y lo que se consigue cuando el pedal del freno es aplicado, una vez que se suelta el pedal, el líquido también es liberado en el freno.

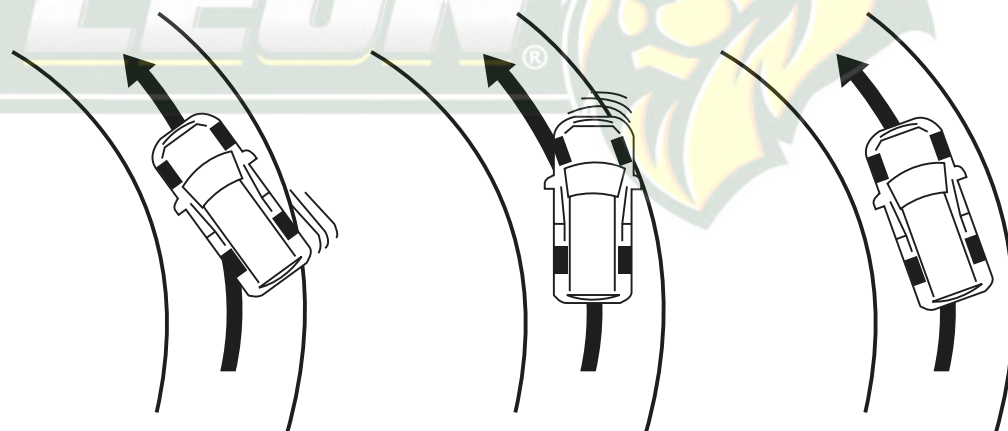

Para lograr este objetivo es necesario tomar en cuenta los siguientes puntos:

1. Coeficiente de fricción
2. Condición de las llantas

### Función del sistema de frenado antibloqueo

Durante una frenada de pánico (emergencia) las ruedas del vehículo pueden bloquearse, provocando que el conductor pueda perder el control del vehículo, representando una situación de conducción peligrosa; el grado de bloqueo se llama deslizamiento y esto ocurre cuando la velocidad del giro de la rueda es menor que la velocidad del vehículo.

El ABS mantiene el deslizamiento necesario de la rueda (15% al 30% aproximadamente) para desacelerar efectivamente un vehículo mientras evita el total bloqueo de la misma.

## Frenos ABS

**Los factores que afectan el deslizamiento de la rueda son los siguientes:**

1. **Coefficiente de fricción** (camino, condición de la llanta y velocidad del vehículo).
2. **Condición de los componentes del freno.**
3. **Frenado controlado por el conductor.**

Sin ser pensado de esta manera, bombear los frenos es el propósito de conservar la estabilidad direccional.

Las acciones siguientes ocurren cuando se aplica presión de frenado y se bombean los frenos:

- La presión aumenta
- Se mantiene la presión
- La presión disminuye

Dicho de otra forma, al aplicar los frenos y al mantener el pedal oprimido, en ese momento se mantiene la presión.

En el momento que el vehículo está perdiendo el control direccional, o el pedal está demasiado bajo, se suelta el pedal del freno. En ese momento la presión de frenado disminuye y el pedal se eleva.

Cuando se recupera el control del vehículo se vuelven a aplicar los frenos, en ese momento se incrementa la fuerza de frenado o presión, este procedimiento (aplicación, liberación, aplicación) continúa hasta que el vehículo desacelere a una velocidad segura.

Si alguna vez ha tenido que frenar su vehículo bombeando los frenos es probable que no pensó que ocurrían las acciones antes descritas.

### Control automático

En un vehículo equipado con ABS el conductor sólo necesita aplicar el freno y conducir el vehículo, ya que las acciones de bombeo las realiza automáticamente el sistema.

Los componentes del ABS realizan esto por nosotros, el sistema detecta cuando es necesario aplicar presión de frenado, mantenerse constante o liberarse.

El sistema calcula el deslizamiento de una rueda en el frenado, si una rueda se bloquea se activa el ABS.

El ABS se divide en tres subsistemas:

### Sensores de velocidad

Estos sensores electromagnéticos producen una señal de velocidad para el controlador electrónico.

Sensor discreto

Sensor integral

### Unidad electrónica de control

Un controlador electrónico de freno antibloqueo (CAB) monitorea la señal del sensor(es) de velocidad de las ruedas y controla a la unidad de control hidráulico, cuando hay una tendencia de bloqueo o disminución brusca de velocidad de una o más ruedas se activa el sistema.

### Unidad de control hidráulico

La HCU realiza el verdadero trabajo de controlar la presión del líquido al conjunto de frenos en un frenado de emergencia y así evitar que las ruedas se bloqueen.

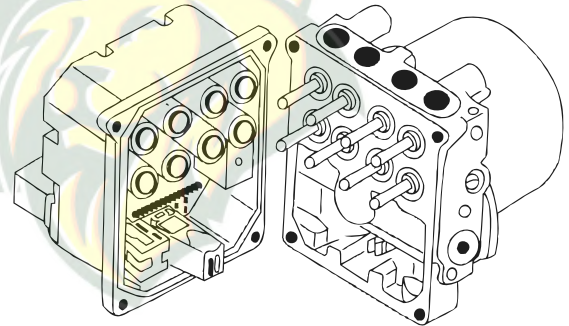

## Frenos ABS

Todas las unidades de control hidráulico (HCU) utilizan válvulas de solenoide, para controlar la presión de fluido en las ruedas.

Lo principal para entender un sistema de freno antibloqueo es observar que el ABS realiza lo antes descrito al bombear los frenos.

El ABS realiza las acciones que a continuación serán descritas en una frenada de pánico.

- Mantiene la presión (sostiene el frenado)
- Disminuye la presión (libera los frenos)
- Aumenta la presión (frenos aplicados o reaplicados)

## Sistemas básicos de freno antibloqueo

### Sistemas hidráulicos

Existen dos tipos de sistemas hidráulicos que usan diferentes sistemas de freno antibloqueo: el sistema abierto y el sistema cerrado, pero para entender bien estos es necesario que conozca acerca de las válvulas de control que se utilizan en el ABS.

Las válvulas que se usan en el ABS realizan las acciones de bombeo que se describió con anterioridad, según el sistema específico usado, trabajan juntas para controlar el líquido para frenos en paradas de emergencia.

Lo interesante es recordar que no importa que sistema sea, la operación del ABS dependerá de la habilidad de retener, liberar o incrementar la presión en los frenos.

### Válvulas y solenoides

Existen tres tipos de válvulas de control que puede encontrar en algunos sistemas de freno antibloqueo:

- Válvulas de aislamiento o de entrada - normalmente abiertas, energizadas para bloquear.
- Válvulas de incremento - normalmente cerradas, energizadas para aplicar presión.
- Válvulas de disminución o de salida - normalmente cerradas, energizadas para liberar presión.

Algunos sistemas antibloqueo pueden tener los tres tipos de válvulas y otros no.

Durante la acción del frenado ABS, la unidad electrónica modula las válvulas energizando los solenoides que controlan a éstas. La palabra "modula" significa que las válvulas cambian muy rápidamente.

### Válvula de aislamiento

Es una válvula normalmente abierta que es operada por un solenoide. Durante el frenado normal, permite que la presión del líquido para freno entre a la unidad de control hidráulico desde el cilindro maestro.

Cuando ocurre un frenado antibloqueo el solenoide se energiza o desenergiza, como lo manda el CAB.

Frenos ABS tipo no integral o abierto

Frenos ABS tipo integral o cerrado

**Válvula de disminución**

También llamada de salida, es una válvula normalmente cerrada operada por un solenoide.

En un frenado normal permite que el líquido fluya desde la Unidad de Control Hidráulico al conjunto de freno de rueda. Durante un frenado antibloqueo, el solenoide se energiza o desenergiza como lo mande el CAB.

La válvula cambia la presión del resorte al energizarse el solenoide. Entonces el líquido desde la rueda afectada fluye dentro de la línea de retomo. Esta acción ocasiona que el frenado de la rueda aumente o disminuya.

**Tipos de sistema**

- Sistemas abiertos
- Sistemas cerrados

En la activación del ABS, la presión del líquido es modulada en tres ciclos:

1. Retener o mantener presión
2. Disminuir o liberar presión
3. Incrementar o aumentar presión

La modulación del líquido es similar a bombear los frenos. En el ciclo de incremento, es necesaria una fuente para el incremento rápido de presión que se requiere para aplicar la acción de frenado a una rueda.

Teniendo la capacidad de entender los dos tipos de sistemas hidráulicos, usted puede determinar de donde viene la presión del líquido.

**Sistemas abiertos (no integral)**

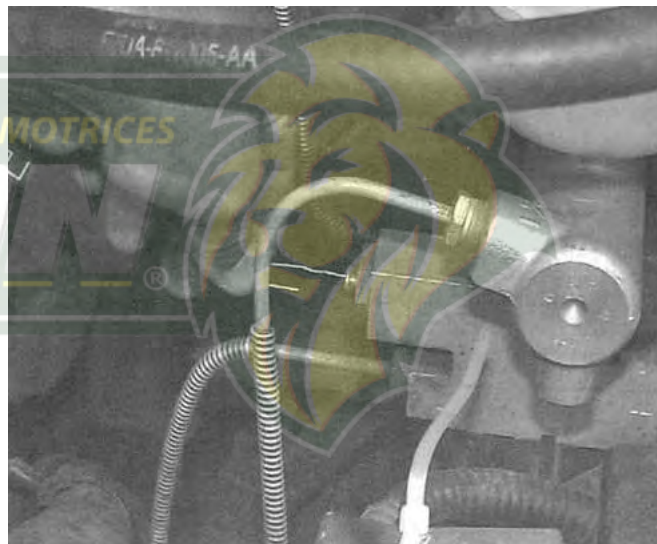

En los sistemas abiertos la principal característica es que en una operación antibloqueo, la presión a realizarse es provista por los puertos primario y secundario del cilindro maestro.

En el funcionamiento del ABS, el cilindro maestro es la fuente de presión en el sistema hidráulico.

En el ciclo de retención la válvula de entrada bloquea el líquido, para evitar que llegue al freno de la rueda afectada y dé la sensación de pedal duro, como consecuencia del movimiento de los pistones del cilindro maestro, los cuales están restringidos durante el ciclo de retención.

A un depósito están conectadas las válvulas de salida, en el ciclo de disminución se abren y liberan la presión en los frenos de las ruedas. El líquido que fue liberado fluye al depósito.

En el ciclo de incremento, las válvulas de entrada se abren y las válvulas de salida se cierran, para que de esta manera el líquido del cilindro maestro sea aplicado al freno de la rueda afectada. El pedal de freno puede bajar rápidamente en ese momento.

## Frenos ABS

### Sistemas cerrados

Una bomba y un acumulador suministran la presión para una operación antibloqueo.

Existen dos tipos de sistemas cerrados:

1. Hidroreforzado.
2. No hidroreforzado.

### PRECAUCIÓN

**Al trabajar con este tipo de sistemas debe seguir las siguientes recomendaciones: desconecte la batería, es necesario bombear la presión en el sistema para bajarla antes de desconectar una línea de presión. Aplique los frenos de 40 a 50 veces hasta que el pedal se sienta "duro", para reducir la presión del líquido en el acumulador, reforzador, bomba y líneas, ya que la presión con la cual funciona este sistema es de 2600 PSI.**

### Hidroreforzado

En la activación del ABS de este sistema, el cilindro maestro se independiza del sistema de freno por el cerrado de las válvulas de aislamiento.

Un circuito de servo de refuerzo es la fuente de presión. Este es alimentado por una motobomba y un acumulador.

En el ciclo de retención las válvulas de incremento son cerradas y la presión generada por la bomba se almacena en un acumulador.

En el ciclo de disminución, el líquido liberado regresa al depósito del cilindro maestro.

Esto ocurre en un ciclo de incremento: se abre la válvula de incremento, la presión es liberada desde el acumulador y bombeada por el servo de refuerzo a los frenos de las ruedas.

Sistema abierto hidroreforzado

Sistemas cerrados no hidroreforzados

### No hidroreforzado

En este tipo de sistemas siguen siendo los acumuladores la fuente de presión.

Un acumulador alimenta el circuito primario y otro el circuito secundario. Este sistema carece de un circuito de refuerzo.

En el ciclo de retención, por el cierre de las válvulas, la presión se bloquea desde la bomba hacia las ruedas, en la disminución el líquido liberado se dirige a los acumuladores. En el ciclo de incremento, las válvulas de entrada se abren, y las de salida se cierran. El líquido a presión generado por la bomba es aplicado a los frenos y se vacía el acumulador hasta el siguiente ciclo de retención. Nuevamente se observa que la bomba y el acumulador son los generadores de presión.

Cuando se activa por primera vez el ABS, los puertos primario y secundario del cilindro maestro generan la presión inicial. Durante la operación del ABS el líquido inicial se mantiene en el ciclo de disminución. El volumen del líquido disminuye conforme se llenan los acumuladores.

La bomba nos sirve para volver a llenar el líquido perdido en el ciclo de disminución y esto también es lo que mantiene al pedal en su posición.

## Frenos ABS

**Cilindro maestro con hidrorreforzador**

Desde entonces este sistema ha sido perfeccionado dando lugar a nuevos modelos aún más seguros, complementado por los siguientes sistemas:

**BAS:** Sistema de Asistencia de Frenado

**EBD:** Distribución Electrónica de Frenado

**BDC:** Control Dinámico de Frenado

**ETC:** Sistema de Reacción Regulado Electrónicamente

**TCS:** Sistema de Control de Tracción

**ASR:** Sistema de Control de Tracción Desconectable

**ESP:** Sistema de Control de Estabilidad

**DSC:** Sistema Dinámico de Estabilidad

**RSC:** Sistema de Control de Tracción Avanzada con Control de Estabilidad

**MBA:** Sistema de Asistencia de Frenado Mecánicamente

**SBC:** Sistema de Control de Frenado en Curvas

**EDL:** Sistema de Bloqueo Electrónico Diferencial

Los autos equipados con este componente en el ABS, cuentan con un cilindro maestro que contiene una válvula de control de refuerzo. Al aplicar el freno, una varilla de empuje aplica presión a la válvula de control de refuerzo, cuando ésta se mueve permite el paso del líquido presurizado desde el acumulador dentro de la cámara del reforzador del cilindro maestro.

El pistón primario es alimentado por la presión en la cámara del reforzador, moviendo al pistón secundario en el cilindro maestro.

Existen sistemas de:

1 canal, 3 canales y 4 canales tales como:  
 Bendix ABX-4, Delco, Bendix, Bosch, Teves Mark IV, Delphi 7.4, Teves Mark 20 Delphi 7, Kelsey Hayes Delco IV, Teves, Nippon denso y Sumitomo.

**Sistemas relacionados con el ABS**

Ha pasado mucho tiempo desde que el ABS revolucionó el mundo del automóvil. Por primera vez un sistema electrónico era capaz de actuar más allá del conductor, regulando la frenada para evitar el bloqueo de las ruedas y manteniendo la dirección del vehículo.

El Bendix 10 se utilizó en vehículos  
 Chrysler de 1991 a 1993

## Consejos Técnicos

### Consejos técnicos para frenos hidráulicos

#### 1. Llenado de cilindro maestro

Algunos propietarios de vehículos, o personal de servicio sin experiencia, llenan el cilindro maestro hasta arriba. Los cilindros maestros se deben llenar sólo hasta la línea de nivel "MÁXIMO", o hasta  $\frac{1}{4}$  de pulgada debajo de la parte superior, para permitir un espacio para la expansión del líquido para frenos cuando se calienta durante la operación normal del sistema de frenos.

Si el cilindro maestro se llena hasta arriba, el fluido de frenos que tiende a expandirse no tendrá espacio para hacerlo, creando una sobrepresión que causa que los frenos se autoapliquen, además de acortar la vida del material de fricción.

#### 2. Revise siempre el puerto de compensación

Siempre que diagnostique cualquier problema de frenado, inicie el diagnóstico en el cilindro maestro que es el corazón de cualquier sistema de frenado. Quite la tapa del depósito y observe si sale un "chorro" de líquido para frenos cuando un asistente oprima el pedal del freno (operación normal se observa movimiento de fluido en el depósito). Debe haber una emisión de fluido de frenos por el puerto de compensación, tanto en la cámara primaria como en la secundaria.

hacia adelante, lo que causa que el sello esté igual con respecto al puerto de compensación. Ajuste la altura del pedal del freno a un nivel más alto y revise la longitud de la varilla de empuje.

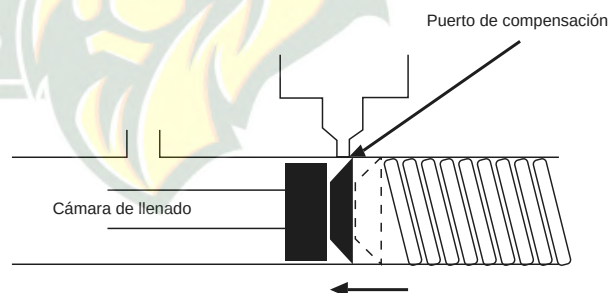

**b) Sello defectuoso o hinchado sobre el pistón primario:** Esto podría causar que el mismo sello obstruya el puerto de compensación, esto es común cuando accidentalmente se rellena el depósito con aceite o derivados de petróleo.

Esto indica que el puerto de compensación está abierto y que el sello primario es capaz de mover el líquido para frenos hacia arriba a través del puerto, antes que el sello bloquee por completo el puerto de compensación conforme se mueve hacia arriba para poner al fluido en condiciones de alta presión.

#### 3. No se observa movimiento alguno de fluido en el depósito del pistón primario

Esto indica que el líquido para frenos no está siendo desplazado cuando se oprime el pedal del freno. Las causas posibles son:

**a) Altura de pedal del freno incorrecta:** el ajuste del pedal del freno o de la varilla de empuje podría estar permitiendo que el pistón primario esté demasiado

## Problemas y causas más comunes en el sistema de frenos

### 1. Pedal bajo y/o esponjoso:

- Fuga en los sellos del caliper
- Aire en el sistema
- Líquido para frenos contaminado con humedad
- Líquido para frenos de baja calidad
- Nivel de líquido bajo
- Excesiva holgura entre la barra de empuje y el pistón del cilindro maestro (bajo pero NO esponjoso)
- Falso asentamiento en balatas

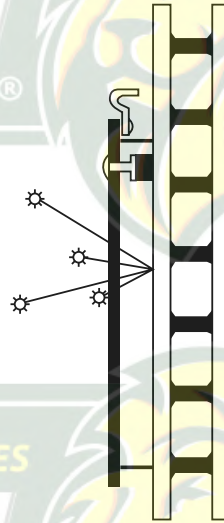

### Freno de disco

#### 2. Ruido:

- Pérdida de partes de herrajería.
- Herrajería desgastada.
- Balatas excesivamente desgastadas.
- Rotores rayados / mal rectificados / acabado inadecuado.
- Balatas contaminadas.
- Balatas mal instaladas.
- Contacto entre rotor y caliper.
- Falta de lubricación en la herrajería y/o lubricante inadecuado.

### 4. Frenos bloqueados

- Pedal del freno atascado o mal calibrado.
- Switch de luz de freno mal ajustado.
- Barra de empuje de booster mal ajustada.
- Pistón de calibrador oxidado, pegado, trabado.
- Manejar con los dos pies (freno/acelerador).

#### Recomendación para tornillo purgador

Antes de retirar el caliper del soporte, afloje y revise el tornillo purgador para asegurarse que no esté pegado ni tapado.

### 5. Jaloneo al frenar

- Mangueras para freno obstruidas o dobladas.
- Partes de hule contaminadas.
- Partes de suspensión mal ajustadas o desgastadas.

### 6. Pulsación en el pedal

- Desalineación lateral en los rotores.
- Falta de paralelismo.
- Variación en el espesor del disco.
- Rectificado excéntrico en rotores y tambores.
- Baleros desgastados.
- Bujes de caliper desgastados.

Gomas primaria y secundaria hinchadas

### 7. Pedal duro

- Pistones de calibrador pegados.
- Balatas cristalizadas.
- Líneas de vacío del booster bloqueadas.
- Bajo poder de asistencia de vacío.
- Ensamble de booster defectuoso.
- Realizar prueba funcional de booster.

### Servicio al freno de tambor

- Inspeccione el desgaste de las balatas.
- Remueva el herraje.
- Inspeccione los soportes de las balatas.
- Inspeccione los pernos y puntos de anclaje.
- Reconstruya / reemplace los cilindros de rueda.
- Reemplace el herraje cuando cambie las balatas.
- Inspeccione el contacto entre la balata y el tambor.

**8. Pedal bajo**

- Aire dentro del sistema.
- Nivel bajo de líquido en el cilindro maestro.
- Ajuste incorrecto o balatas gastadas.
- Excesivo juego en la varilla de empuje del cilindro maestro.
- Falla en una de las secciones del cilindro maestro.
- Falla en el booster de poder.
- Mangueras deterioradas o débiles.
- Baja calidad del líquido para frenos.
- Pared de soporte flexible en Chevrolet, camionetas Ford y otros.
- Válvula de presión residual del cilindro maestro dañada (si está integrada al cilindro maestro).
- Realice prueba de aislamiento

Manguera desgastada

**9. Pedal esponjoso**

- Baja calidad del líquido para frenos.
- Aire dentro del sistema.
- Tambores gastados o agrietados que oscilan bajo presión.
- Buje pivote del freno gastado / dañado.
- Realice prueba de aislamiento

**10. Pedal que baja lentamente**

- Fuga interna en el cilindro maestro
  - Fuga en el cilindro de rueda
  - Cualquier fuga externa
- Realice prueba de aislamiento.

**11. Pedal alto**

- Ajuste incorrecto de la varilla de empuje del cilindro maestro.
- Balatas sobre-ajustadas (no hay holgura entre la balata y la superficie del tambor).

**12. Pulsación del pedal**

- Tambor fuera de circunferencia (ovalado).

**Cilindro de rueda**

### Freno de tambor

#### 13. Pedal duro

- Balatas contaminadas o cristalizadas.
- Mangueras restringidas o dañadas.
- Partes de hule del cilindro maestro o cilindro de rueda contaminadas.
- Falla en el booster de poder.
- Palanca del pedal del freno pegada.
- Manguera del múltiple de admisión al booster de poder con fuga/rota.
- Conector de vacío tapado en el booster de poder.
- Insuficiente vacío.

#### 14. Arrastre o jaloneo al frenar

- Neumáticos desgastados o presión incorrecta.
- Balatas contaminadas.
- Ajuste incorrecto en el freno de estacionamiento.
- Kit de resortes rotos o desgastados.
- El pedal del freno no retorna correctamente.
- Partes dañadas de la suspensión.
- Baleros desajustados en las ruedas.
- Puertos bloqueados o restringidos en las líneas o en el cilindro maestro.

#### 15. Frenos semi-bloqueados / jaloneos

- Ajuste incorrecto de la varilla de empuje del cilindro maestro.
- Líquido para frenos espeso o pegajoso que no está fluyendo adecuadamente.
- Gomas de cilindro de rueda contaminadas.
- Diferentes diámetros de tambor en el eje.
- Tambores ovalados.
- Zapatas de freno trabadas por estar desgastado el plato portabalatas.
- Problemas de suspensión o dirección.

#### 16. Frenos ruidosos

- Golpeteo en las balatas, tambor estrellado o marcas de rectificado áspero.
- Roce de balatas, tambor rectificado fuera de centro o resortes de retorno rotos o vencidos.
- Rechinido por balatas cristalizadas.
- Balatas contaminadas.
- Polvo en los tambores.
- Platos portabalatas torcidos.
- Zapatas distorsionadas.
- Diferente tipo de balatas en el eje.
- Falta de lubricante en la herrajería o en el plato porta balatas.

## Consejos técnicos para frenos ABS

Ya hablamos de los componentes del Sistema de Frenos Antibloqueo, observamos que el funcionamiento de este sistema es netamente electrónico y complementado por los componentes mecánicos y de fricción. El primer paso para diagnosticar correctamente un problema del sistema de bloqueo es revisar el estado de las lámparas de advertencia, Brake (roja) y/o ABS (ámbar).

### Lámpara roja

Advierte una falla o problema en el sistema de frenos convencional, también encenderá si el freno de estacionamiento fue aplicado. Asimismo nos indica que hay un problema de baja presión en un sistema integral o presurizado, en los sistemas RWAL de General Motors nos indicará cuando el sistema antibloqueo tenga una falla de acuerdo a su intensidad (baja intensidad falla ABS, alta intensidad freno de estacionamiento aplicado o problema hidráulico).

### Lámpara ámbar

Esta lámpara encenderá después del arranque, durante la secuencia de inicialización o autodiagnóstico, el tiempo exacto que permanece encendida esta lámpara varía de acuerdo al vehículo y el diseño del ABS.

### Inspección visual completa

Muchos problemas relacionados con el ABS se pueden diagnosticar con rapidez, si se inspeccionan cuidadosamente los siguientes puntos básicos:

1. Nivel de líquido para frenos. Revise las condiciones del líquido para frenos, así como el nivel.
2. Fugas de líquido para frenos. Revise en busca de fugas las mangueras y otros componentes.
3. Fusible y eslabones fusibles. Revise todos los fusibles que tengan relación con el ABS.
4. Cableado y conexiones. Revise todo el cableado, especialmente los cables de los sensores de velocidad de la(s) rueda(s) en cuanto a daños.
5. Sensores de velocidad. Revise que no esté dañado el arillo (dientes), limpie el sensor si es posible.

### Qué es ese ruido y esa vibración Sensor de velocidad

Muchos propietarios de vehículos y técnicos de servicio se han sentido intrigados al escuchar y sentir un ruido ocasional al oprimir el pedal del freno. Se suele escuchar y sentir a través del vehículo luego del arranque y conducción iniciales. Este ruido ocurre cuando se conduce por primera vez para adelante o hacia atrás, muchos técnicos han culpado a la transmisión o componentes relacionados con la línea de transmisión.

## Consejos Técnicos

### Cómo recuperar códigos de falla para diagnóstico

Después de efectuar una revisión visual completa y luego de verificar la queja del cliente, recupere los códigos de falla para diagnóstico almacenados, relacionados con el ABS.

El procedimiento exacto varía con el tipo de ABS, con la marca, modelo y año del vehículo.

Consulte siempre el manual de servicio de cada vehículo que va a diagnosticar.

Algunos sistemas sólo pueden desplegar códigos de destellos (haciendo destellar la lámpara de ABS o frenos en cierto orden), mientras que otros sistemas pueden efectuar autodiagnóstico y proporcionar la información al técnico mediante una herramienta de diagnóstico (escáner).

En muchos vehículos equipados con doble tracción (4x4), el ABS se modifica y en otros se inhabilita.

### Sistemas Kelsey Hayes

En los camiones GM equipados con sistemas RWAL, haga destellar la lámpara del ABS, usando la herramienta de exploración (Tech 1/11) o conecte un cable puente entre la cavidad H y la cavidad A del conector de diagnóstico.

En camiones Ford (RABS) sólo códigos de destello mediante una conexión de puente.

En camiones Chrysler, conecte a tierra las conexiones de diagnóstico.

Multímetro

Punteando las terminales del conector DLC

### Diagnóstico de válvula del sistema Kelsey Hayes

#### Diagnosticando la válvula RWAL

##### 1 a. Generación

1. Retirar la tapa y el resorte del pistón del acumulador hidráulico. Si tiene líquido la válvula, se deberá sustituir.

2. Aplicar el pedal del freno y checar que el pistón del acumulador no tenga movimiento, de lo contrario la válvula se deberá sustituir.

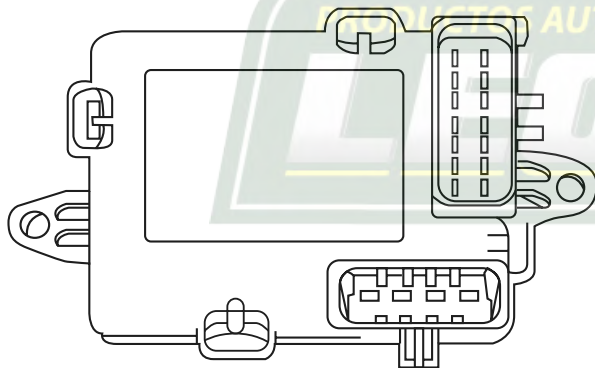

## Diagnosticando la válvula RWAL

### 2a. Generación

1. Retire el cubrepolvo.
2. Aplique el freno y revise que no se mueva el pistón de la válvula.

### Lo que usted debe saber cuando reemplace un CAS:

1. Programar el tipo de eje y la medida de la llanta.
2. Programar el VIN. Esta programación se debe realizar vía electrónica (escáner).
3. Para tener una exitosa programación en la memoria del CAS siga las instrucciones del escáner.

### Sistema RWAL

El diseño de este sistema es de un sólo canal (frenos traseros).

Al igual que los demás sistemas, utiliza un CAS que es un microprocesador que monitorea la correcta operación del sistema realizando una autopruueba de diagnóstico.

Al diagnosticar los componentes del ABS es necesario que contemos con un multímetro digital y un escáner.

### Cómo interpretar los diagramas eléctricos Colores de los cables

Los colores básicos de corriente y tierra son:

|          |                                              |
|----------|----------------------------------------------|
| Rojo     | + 12 volts                                   |
| Amarillo | + 12volts                                    |
| Azul     | Circuito luces de posición o identificadores |
| Negro    | Tierra                                       |

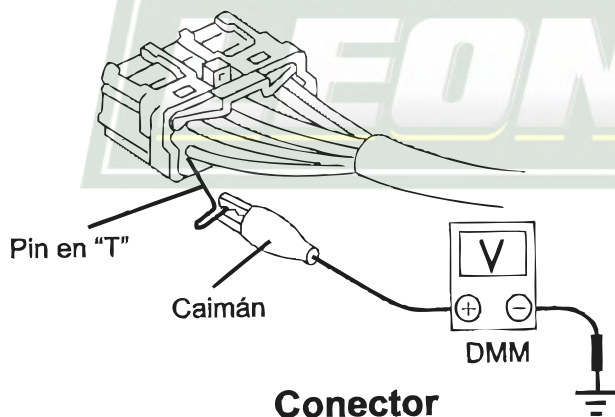

También encontramos los colores siguientes para los demás cables y conectores.

|    |                  |    |         |
|----|------------------|----|---------|
| BA | Blanco           | NO | Negro   |
| BE | Azul             | OR | Naranja |
| BJ | Beige            | RG | Rojo    |
| CY | Cristal o blanco | SA | Salmón  |
| GR | Gris             | VE | Verde   |
| JA | Amarillo         | V  | Violeta |
| MA | Marrón           |    |         |

### Cómo comprobar las terminales

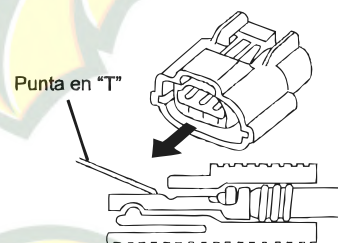

Un conector dañado o una conexión intermitente pueden resultar de una prueba inadecuada del conector durante las comprobaciones de circuitos.

Para comprobar el conector adecuadamente, utilice una punta en forma "T". Para un mejor contacto, sujete la punta "T" utilizando un caimán.

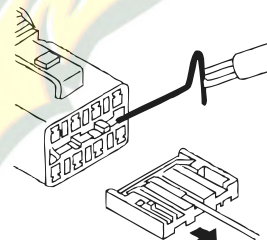

### Comprobación del lado de la Terminal Terminal hembra

Hay una pequeña ranura sobre cada terminal hembra. Compruebe cada terminal con la punta en "T" a través de la ranura. No inserte ningún objeto en la terminal hembra, solamente que sea una terminal tipo macho.

**Terminal hembra**

Algunos conectores no tienen una ranura sobre cada terminal. Para comprobar cada terminal, remueva el retén del conector para hacer contacto con la superficie.

**Seguro conector**

### Cómo comprobar la fatiga del muelle del contacto de la terminal

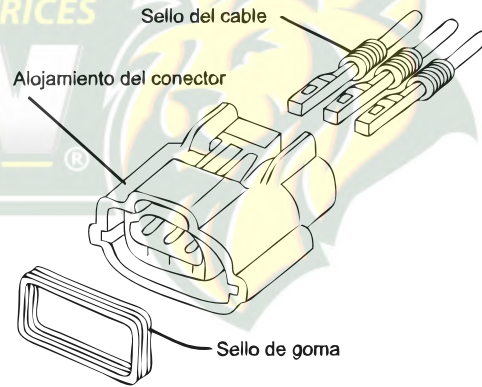

Un muelle de contacto fatigado en una terminal puede crear señales intermitentes en el circuito. Si se presenta un circuito abierto, realice el siguiente procedimiento para localizar los cables abiertos y los muelles de contacto fatigados en las terminales hembra.

1. Ensamble una terminal macho en un cable de aproximadamente 10 cm (3.9 pulg). Use una terminal macho que se acople a la terminal hembra.
2. Desconecte el extremo del arnés sospechoso de falla y mantenga su terminal hacia arriba.

### Inspección de los sellos de hule

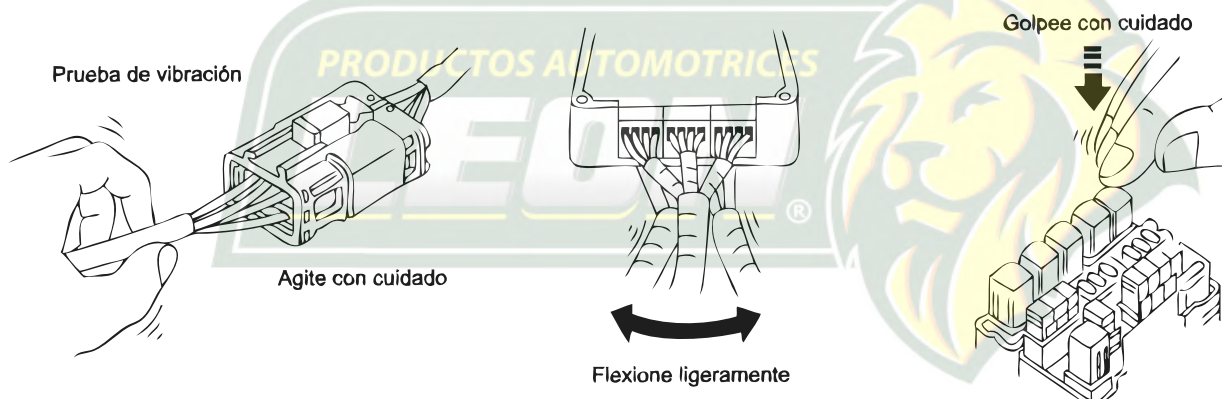

• La mayoría de los conectores impermeables se suministran con un sello de hule entre las terminales macho y hembra. Si falta el sello, el desempeño a prueba de agua puede no satisfacer las especificaciones.

• El sello de hule podría desprenderse cuando es desconectado el arnés. Siempre que éste se vuelva a conectar, asegúrese de que el sello de hule está instalado adecuadamente en cualquier lado de la terminal macho o hembra.

### Conectores y cables eléctricos

- Determine que conectores y arnés de cableado afectan al sistema eléctrico que está inspeccionando.
- Suavemente agite cada conector y arnés mientras monitorea el sistema en busca del incidente que está tratando de reproducir. Esta prueba puede indicar que hay una conexión eléctrica suelta o mal hecha.

## Consejos Técnicos

### Compartimiento del motor

Hay varias razones de vibraciones en un vehículo o motor que pueden causar problemas eléctricos. Algunas de las cosas que hay que comprobar son:

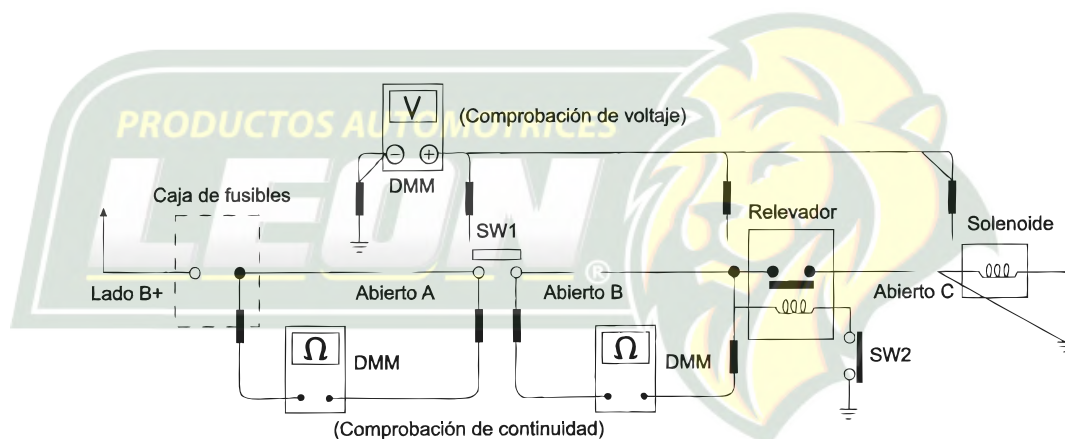

- Los conectores no están bien ensamblados.
- El cable no es lo suficientemente largo y está sometido a esfuerzos causados por las vibraciones del motor o al balanceo.
- Cables que pasan por soportes o componentes móviles.
- Cables a tierra sucios, sueltos o corroídos.
- Cables instalados demasiado cerca de componentes calientes.

### Inspección del circuito

- **ABIERTO:** un circuito está abierto cuando no hay continuidad a través de una sección del mismo.
- **CORTO:** existen dos tipos  
 Cortocircuito: cuando un circuito hace contacto con otro y provoca el cambio en la resistencia normal.  
 Corto a tierra: cuando un circuito hace contacto con un elemento conectado a tierra.

### Método de comprobación de la continuidad

La comprobación de continuidad se emplea para encontrar el punto abierto del circuito. El multímetro digital ajustado en la función de resistencia, indicará un circuito abierto como sobre límite (no hay indicación acústica o lectura de ohm). Asegúrese de colocar el multímetro en el valor de resistencia más alto.

### Método de comprobación de la resistencia

1. Desconecte la terminal negativa del acumulador y quite el fusible que se ha fundido.
2. Desconecte todas las cargas (SW1 abierto, relevador y solenoide desconectados) que están activadas a través del fusible.
3. Conecte una sonda del ohmetro a la terminal de carga del fusible y la otra a tierra.
4. Con SW1 abierto, compruebe la continuidad. "Continuidad: el corto está entre la terminal del fusible y SW1 (punto A)". "No Continuidad: el corto está más adelante de SW1".
5. Cierre SW1 y desconecte el relevador. Coloque las sondas en la terminal de carga del fusible y tierra. Luego, compruebe la continuidad. "Continuidad: el corto está entre SW1 y el relevador (punto B)". "No Continuidad: el corto está más adelante del relevador".
6. Cierre SW1 y haga un puente con un alambre entre los contactos del relevador. Coloque las sondas en la terminal de carga del fusible y tierra en buenas condiciones. Después compruebe la continuidad. "Continuidad: el corto se encuentra entre el relevador y el solenoide (Punto C)". "No Continuidad: compruebe el solenoide y repita los pasos anteriores".

### Inspección de conexión a tierra

Las conexiones a tierra suelen estar expuestas a la humedad, el polvo y otros materiales corrosivos. La corrosión (oxidación) puede convertirse en una resistencia indeseada. Ésta puede cambiar la manera en que funciona un circuito.

Los circuitos controlados electrónicamente son muy sensibles a su conexión correcta a tierra. Una tierra suelta o deficiente puede afectar drásticamente a un circuito controlado electrónicamente.

La corrosión puede afectar fácilmente a un circuito.

Incluso cuando la conexión a tierra parece limpia puede existir una fina capa de óxido en su superficie.

### Fallas de alta resistencia

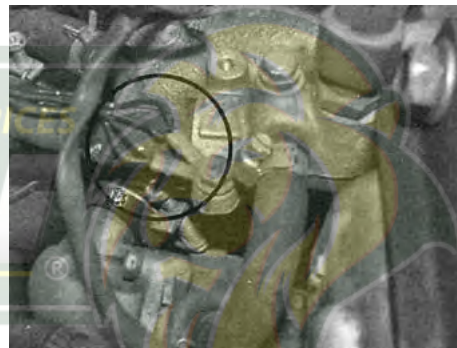

Incluyen aberturas en el circuito y áreas donde las conexiones pueden estar flojas, sucias o corroídas y se pueden reflejar en lámparas que se atenúan, motores que trabajan lentamente o un dispositivo que no funciona.

### Fallas de baja resistencia

Incluyen cortos circuitos y circuitos que tienen tierras no establecidas.

Síntomas:

- Fusible fundido
- Dispositivo sin funcionar
- Aislamiento quemado del cable
- Un circuito o componente que utiliza más corriente de la especificada

### Relevadores

Los relevadores cumplen con las especificaciones de la Organización de Normas Internacionales con respecto al tamaño común y el patrón de la terminal. Se localizan en el centro de distribución de energía.

### Cables

El cable es el conductor que se usa en los sistemas eléctricos automotrices para completar el circuito entre los dispositivos eléctricos y la fuente de energía.

Todos los circuitos en los sistemas eléctricos de los vehículos están designados por una serie de letras y números.

## Consejos Técnicos

### Leyendas de símbolos que se usan en diagramas de alambrado

#### Tamaño del cable

El uso de un cable de tamaño apropiado es crítico debido a que el flujo de corriente es sensible a los cambios de resistencia.

Hay que considerar el número de calibre del cable y la longitud del mismo (1 m de cable = 1 W de resistencia).

### Cómo leer un diagrama

Los diagramas eléctricos se parecen a un mapa de caminos de circuitos eléctricos. Para “seguir” el flujo de electricidad a través de un circuito, comience a partir de la batería o fusible de alimentación.
